工作原理

Working Principle

一、传感器原理

差压变送器包括两个功能单元：

①主单元，②辅助单元。

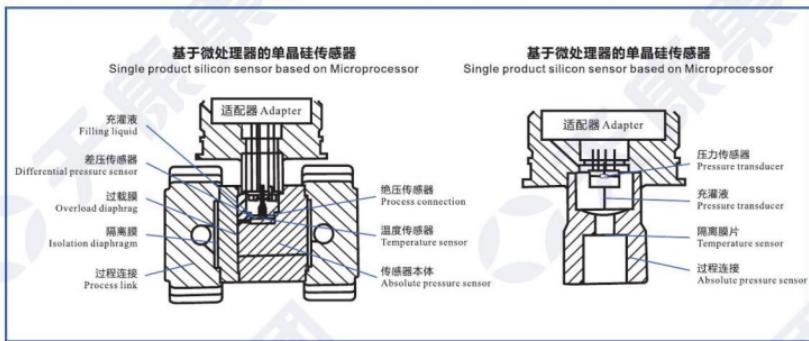

主单元包括传感器和过程连接，工作原理如下：传感器模块采用全焊接技术，内部拥有一个整体化的过载膜片，一个绝对压力传感器、一个温度传感器和一个差压传感器。绝压传感器只装在传感器膜盒的高压侧，做为静压测量和补偿的参考价值。温度传感器做为温度补偿的参考值，差压传感器的负压侧与传感器膜盒的低压腔相连，差压通过隔离膜片和填充液，传递给差压传感器的硅芯片，使差压传感器的芯片的阻值发生变化，从而导致检测系统输出电压变化。该输出电压与压力变化成正比，再由适配单元和放大器转化成以标准化信号输出。

Sensor principle

The differential pressure transmitter consists of two functional units:

Main unit,Auxiliary unit.

The main unit comprises a sensor and process links, the working principle is as follows: the sensor module adopts the welding technology, has an integrated overload diaphragm, an absolute pressure sensor, a temperature sensor and a pressure sensor. The pressure sensor is installed on the high pressure side of the sensor box, which is the reference value of static pressure measurement and compensation. As the temperature sensor for temperature compensation of the reference value, the low pressure chamber side and negative pressure sensor diaphragm differential pressure sensor is connected to the differential pressure through the diaphragm and liquid filling, transfer to the silicon chip differential pressure sensor, the differential pressure sensor chip resistance changes, resulting in the detection system of the change of output voltage, the output voltage changes with pressure the signal is proportional to the output of the amplifier adapter unit and transformed into a standard.

主单元包括传感器的过程连接，工作原理如下：过程介质通过柔性、抗腐蚀性的隔离膜片以及填充液的压力传感器测量膜片上施加压力，压力传感器测量膜片的另一端接大气（用于表压测量）或真空（用于绝压测量）。从而使传感器硅芯片的阻值发生变化，导致检测系统输出电压变化。该输出电压与压力变化成正比。再由适配单元和放大器转化成一标准化信号输出。

The pressure transmitter consists of two functional units:

Main unit,Auxiliary unit

The main unit comprises a sensor process link, the working principle is as follows: the pressure diaphragm process through the medium of flexibility, corrosion resistance and pressure sensor diaphragm of filling liquid, the other end is connected with the atmospheric pressure sensor (for measuring diaphragm gauge pressure (or vacuum) for absolute pressure measurement). Therefore, the resistance of the silicon chip of the sensor changes, which results in the change of the output voltage. The output voltage is proportional to the pressure change. And then converted into a standard signal output by the adapter unit and amplifier.

三、产品说明

传感膜头

3051C型采用先进技术及生产线制造的高品质传感器。传感器与过程介质和外部环境保持机械、电气及热隔离。传感器远离过程法兰，移至电子外壳的颈部，可实现机械隔离和热隔离。该设计使传感器不与过程热源直接接触，并释放了传感器杯体上的机械应力，可提高静压性能。

玻璃密封的压力输送管与传感器杯体绝缘安装，保证了电气绝缘，可提高电子线路的灵活性、性能与耐瞬变电压保护的能力。

3051C型传感膜头还可以进行温度测量，用于补偿温度影响。

在工厂的特性化过程中，所有传感器都经受了整个工作范围内的压力与温度循环测试。根据由此得来的数据产生修正系数，然后将系数贮存于传感膜头的内存中，从而可保证变送器运行过程中能精确地进行信号修正。

Product Description

Sensing film head

3051C is high quality sensor manufactured with advanced technology and production line. The sensor is isolated mechanically, electrically and thermally from process medium and external environment. The sensor is away from the process flange, moved to the neck of the external electronic shell and able to realize the mechanical and thermal isolation. With this design, the sensor does not contact directly the process thermal source and the mechanical stress on the sensor cup is released so that the static pressure performance can be improved.
The pressure transportation pipeline sealed with glass is installed with sensor cup in insulated way, which guarantees the electric insulation, improves the flexibility and performance of electronic circuit and the protection ability to withstand transient voltage. 3051C sensing film head can also be used to measure the temperature and compensate for the temperature influence.

During the plant characterization process, all the sensors experience the pressure and temperature cycle test within the whole operation range. The correction coefficient is produced based on the obtained data and then the coefficient is stored in the memory of the sensing film head so as to guarantee that the transmitter can make correct signal correction during the operation.

该种传感膜头的内存也可帮助加快维修过程。因为所有膜头的特性值都贮存在膜头中，所以可直接更换线路板而无需重新校验或拆下独立的贮存。使用HART手操器可以方便地对3051型进行组态。组态由两部分组成。首先，设定变送器的工作参数，包括：储存修正系数的PROM。

传感膜头内还有线路板，它将输入的电容与温度信号直接转换成可供电子板模块进一步处理的数字化信号。

电子线路板

电子板采用专用集成电路(ASIC)与表面封装技术。该板接收来自传感膜头的数字输入信号及其修正系数，然后对信号进行修正与线性化。电子板模块的输出部分将数字信号转为模拟输出，并与HART手操器进行通讯。标准的模拟型输出为4-20mA。

可选液晶表头插在电子板上，以压力、流量或液位工程单位或模拟量程值百分比显示数字输出，变送器均可选用液晶表头。

数据存储

组态数据存储于变送器电子板模块的永久性EEPROM存储器中。变送器掉电后，数据仍保存，故而上电后变送器能立即工作。

数/模转换与信号传送

过程变量以数字式数据存贮，可以进行精确地修正和工程单位的转换。信号经修正后的数据转换为模拟输出信号。HART手操器可以直接以数据信号方式存取传感器读数，不经过数/模转换以得到更高精度。

通讯格式

3051型采用HART协议进行通讯，该协议使用了工业标准Bell202频移调制（FSK）技术。在模拟输出上叠加高频信号可以进行远程通讯。采用该技术，能在不影响回路完整性的情况下，实现同时通讯和输出。

软件功能

HART协议使用户可以容易地使用3051型的组态，测试与具体设定的功能。

组态

使用HART手操器可以方便地对3051型进行组态。组态由两部分组成。首先，设定变送器的工作参数，包括：零点与量程设定点。

线性或平方根输出

阻尼

工程单位选择

其次，可将信息性数据输入变送器，以便对变送器进行识别与物理描述，包括：

The memory of this kind of sensing film head can also help facilitate the maintenance. Since all the characteristic value of the film head is stored in the film head, the circuit board can be replaced directly without re-calibration or removing the independent storage. It is easy to configure 3051 type with HART communicator. The configuration consists of two parts. Firstly, set the working parameters of the transmitter, including: store the PROM of correction coefficient.

There is also circuit board in the film sensing head which converts directly the input capacitance and temperature signal to the digital signal which can be further processed by the electronic board module.

Electronic circuit board

The electronic circuit board uses special integrated circuit (ASIC) and surface mount technology. This board receives the digital input signal from the sensing film head and its correction coefficient and then make correction and linearization for the signal. The output part of the electronic board module converts the digital signal to analog output and communicates with the HART. Standard analog output is 4-20mA. Optional liquid crystal meter is inserted on the electronic board which shows the digital output with pressure, flow or liquid level engineering unit or analog range percentage. The transmitter can use liquid crystal meter.

Data storage

The configuration data is stored in the permanent EEPROM memory of the electronic board module of the transmitter. After the transmitter loses power, the data is still kept, thus the transmitter can start work immediately after power on.

D/A conversion and signal transmitting

The process variable is stored in the form of digital data which can correct accurately the conversion with engineering unit. The signal is converted to analog output signal via converted data. HART device can access directly the reading of sensor in the form of the digital signal and get higher accuracy without A/D conversion.

Communication format

3051 type adopts HART protocol for communication which uses industrial standard Bell202 frequency shifting keying (FSK) technology. High frequency signal is superposed on the analog output to make remote communication. This technology enables communication and output at the same time without affecting the integrity of the circuit.

Software function

HART protocol enables the user to use easily the 3051 type configuration and test the specifically set functions.

Configuration

It is easy to configure the 3051 type with HART communicator. The configuration consists of two parts. Firstly, set the working parameters of the transmitter, including: zero point and range set points

Linear or square root output

自诊断与测试

3051型可以进行连续自检。当出现问题时，变送器将激活用户选定的模拟输出报警，显示故障代码。HART手操器可以查询变送器，确定问题所在。变送器向手操器输出特定信息，以识别问题，从而快速而便捷地采取维修措施。若操作员确认是回路有问题，可让变送器给出特定输出，以供回路测试。

Remote transmitting information

Apart from the configurable parameters above, there is also some information that the user can not change in the 3051 type software: transmitter type, limit value of the sensor, minimum range, filling liquid, material of isolation diaphragm, film head type and version of transmitter software.

Self diagnosis and testing

3051 type can make continuous self-check. When there is problem, the transmitter will activate the analog output alarm selected by the user. Display fault code. HART device can inquire about the transmitter and determine the problems. The transmitter outputs specific information to the HART device so as to recognize the problem and take maintenance measures rapidly and conveniently. When the operator confirms that there is problem with circuit, he can let the transmitter give specific output to test the circuit.

Specific setting

Specific setting is required during initialization of transmitter and maintenance of digital electronic board. It allows the fine tuning of the sensor and analog output so as to meet the pressure standard of the plant. Besides, characterized function enables the user to prevent the analog output setting point from accident or intentional adjustment.

零点与量程调整要求

零点与量程值可在表1-表3中所标明的量程极限内任意设定。量程必须大于或等于表1-表3中所标明的最小量程。

应用场合

液体，气体与蒸汽的测量场合。

输出

二线4-20mA，用户可选线性或平方根输出。数字过程变量叠加于4-20mA信号上，适用于任何使用HART协议的主机。

电源

需要外部电源。标准变送器(4 - 20 mA)空载时工作。在回路负载极限最大回路电阻由外部电源供电电压决定，关系如下：

$$\text{最大回路电阻} = 41.5 \text{ (电源电压-10.5)}$$

Adjustment requirements for zero point and range

The zero point and range value can be set arbitrarily within the range limit indicated in table 1-table 3.
The range must be larger than or equal to the minimum range indicated in table 1-table 3.

Application occasions

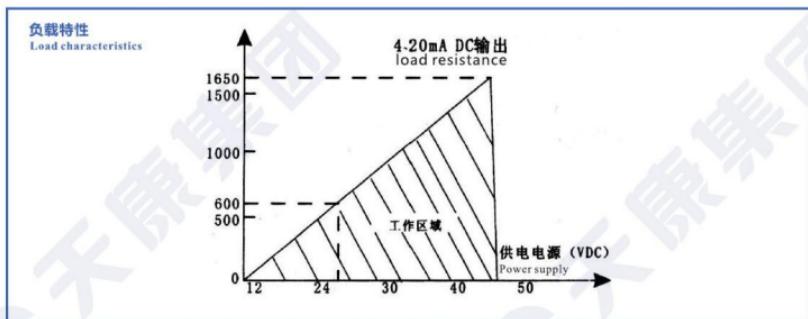

Application When liquid, gas and steam is measured.

Output

Two wire 4-20mA, the user can select linear or square root output. The digital process variable is superposed on the signal of 4-20mA, applicable to the host using HART protocol.

Power supply

External power supply is required. Standard transmitter (4 - 20 m A) works during no load condition. The maximum circuit resistance is determined by the voltage of external power supply with the relationship as follows:
Maximum circuit resistance = 41.5 (power supply voltage-10.5)

1199远传膜片密封件系统

1199 Remote Transmitting Diaphragm Sealing System

TK3051CD/TK3051T变送器带远传密封装置后，就成为TK3051CD/TK3051T远传差压/压力变送器

TK3051CD/TK3051T远传差压/压力变送器，可避免被测介质直接和变送器的隔离膜片接触的可靠测量方法，它适用于下面几种情况：

- 1、被测介质对变送器接头和敏感元件有腐蚀作用时；
- 2、需要将高温被测介质与变送器隔离开时；
- 3、被测介质中有固体悬浮物或高粘度易堵塞变送器接头和压力容室时；
- 4、被测介质引用压管引出易固化或结晶时；
- 5、更换被测介质需要冲洗而不容交混时；
- 6、必须保持卫生条件，防止污染时。

TK3051CD/TK3051T型带远传密封装置的远传差压/压力变送器，仍具有TK3051CD/TK3051T型差压/压力变送器的各种特点：

提供多种结构材料，远传装置组件焊接结构，可靠性强。充液腔低容积设计，减少温度影响，根据温度要求使用相应的灌充液。

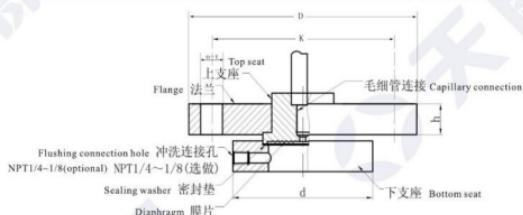

When TK3051CD/TK3051T transmitter has remote sealing device, it becomes TK3051CD/TK3051T remote differential pressure/pressure transmitter.

TK3051CD/TK3051T remote transmitting differential pressure/pressure transmitter is a reliable measurement approach which can prevent the medium being measured from directly contacting the isolation diaphragm of the transmitter and it is applicable to the following conditions:

1. When the medium being measures is corrosive to the transmitter joint and sensitive elements;
 2. When the high temperature medium being measured has to be isolated from the transmitter;
 3. When there are solid suspended matters in the medium or when the medium is highly viscous which is easy to block the transmitter joint and pressure chamber;
 4. When the leading-out medium with the pressure-leading tube is easy to solidify or crystallize.
 5. When medium replacement requires flushing and it is not easy to mix.
 6. When hygiene conditions must be kept to prevent the pollution.
- TK3051CD/TK3051T remote transmitting differential pressure/pressure transmitter with sealing device still has various characteristics of TK3051CD/TK3051T differential pressure/pressure transmitter. Various structure materials are provided. The assembly welding structure for remote transmitting device is highly reliable. The liquid filling chamber is designed with low volume to reduce the temperature influence. Relevant filling liquid shall be used depending on the temperature requirements.

Product introduction

This model is the variant of TK3051T standard intelligent pressure transmitter, which has seal isolation diaphragm structure added on TK3051T. The process connection type is thread screw-in type, flat flange type, extended convex flange and welded thread type. The flange type isolation diaphragm can be made of multiple kinds of alloy material and plastic coated alloy. With temperature isolator or capillary, it is able to withstand 300°C medium. It expands greatly the application range and suitable for measurement of medium with high temperature, strong corrosion and large viscosity. Its performance is basically the same as TK3051T type except the temperature influence index.

二、TK-HB导压式液位变送器

TK-HB air guide type liquid level transmitter

TK-HB导压式(静压)液位变送器是一种结构独特、实用性能很强的液位仪表。它与传统的投入式液位计的最大不同点在于传感器不直接和介质接触。是通过导压管内空气将液位的高低变化，传到传感器上。这样就避免了传感器的堵塞，损害腐蚀，大大延长了仪表的使用寿命。因其独特的设计，使之特别适用于测量高温、高粘度、混油、强腐蚀性液体。如重油、渣油、浆料、硫酸、污水等，是传统投入式液位变送器的理想替代品。导压式液位变送器广泛应用于石化、钢铁、能源、食品、污水处理、制药、自来水等行业的敞口容器的液位测量。

导压式液位变送器应用：工业现场液位测量与控制、城市供水及污水处理、石油、化工、电厂、水文监测、水库、大坝、水电建设等领域的液位的测量与控制。

TK-HB air guide type liquid level transmitter TK-HB pressure (static pressure) liquid level transmitter is a liquid level instrument with unique structure, strong practicability. The biggest difference between it and the traditional input type liquid level gauge is that the sensor is not directly contact with the medium. The liquid level is changed by the air in the air guide pipe, and the air is transferred to the sensor. In this way, the blockage of the sensor is avoided, the corrosion is damaged, and the service life of the meter is prolonged. Because of its unique design, so that it is particularly applicable to the measurement of high temperature, high viscosity, turbidity, strong corrosive liquid. As of heavy oil and residual oil slurry and sulfuric acid, sewage and other, traditional investment type liquid level transmitter is an ideal substitute of guide type liquid level transmitter is widely used in petrochemical, steel, energy, food, sewage treatment, pharmaceutical, water and other industries of the exposure container liquid level measurement.

Guide pressure liquid level transmitter application: industrial field liquid level measurement and control, urban water supply and wastewater treatment, petroleum, chemical industry, power plants, hydrological monitoring, reservoirs, dams, hydropower construction and in the field of liquid level measurement and control.

一、工作原理

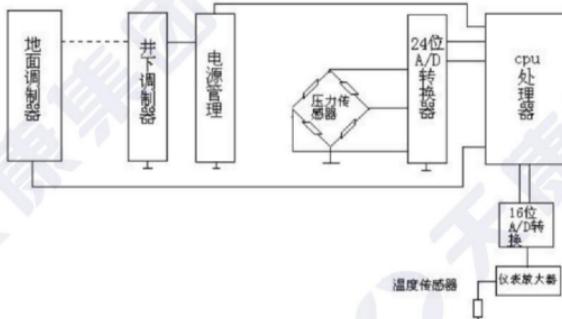

数字井下压力计的工作原理，压力传感器将压力信号变换为电压信号，经仪表放大器放大后再经A/D变换器变换为数字信号，然后由微处理器采样并处理，采用测井专用电缆传送至地面，由地面的调制解调器传给测控系统。

Working principle

Working principle of digital downhole pressure gauge: The pressure sensor converts the pressure signal into a voltage signal, and the instrument amplifier is amplified and then converted to digital signal by A/D converter. After that, It is sampled and processed by the microprocessor. The special logging cable is sent to the ground, and the modem on the ground is transmitted to the measurement and control system.
